

User's Guide to the `evautofl` package*

Emanuele Vicentini
(`emanuelevicentini at yahoo dot it`)

2005/01/20

Abstract

This package provides an environment within which pages are framed with cut lines and printed with punch-marks, so that printed text can easily be inserted into a filofax or binder.

1 Brief Introduction

For the original documentation see the files `calguide.tex` and `autofilo.dtx` distributed in the L^AT_EX Calendar Bundle.

The original code has been brutally hacked to “cut” the coupled pages so now it is possible to mangle the output with `pstops` or `psnup` to have, say, two or more pages on a single sheet and with a duplex printer (or a simplex one and a lot of patience) save a lot of paper. For a brief introduction to `pstops` see §3.

*This file is version number 0.3; it was last revised on 2005/01/20. Many thanks to Geert Kloosterman for the priceless bug reports.

This manual is typeset according to the conventions of the L^AT_EX DOC-STRIP utility which enables the automatic extraction of the L^AT_EX macro source files [GMS94].

2 About the Style

This style provides a rough solution to the design problem it addresses, but it does work. Pages are always printed in landscape, rotated using the `lscap` package from the `graphics` bundle, and centered on the physical paper¹. It accepts two options, `twocolumn` (the default) and `fourcolumn`.

The style provides an environment called `autofilo`. Most often, users of this package will be style authors who want to incorporate it into other environments that do more specific things. Because `autofilo` accepts several `keyval`-style parameters, style authors may have a use for documentation for those optional parameters. So here is some sample documentation:

punchcluster Most filofaxes have two or more clusters or groups of punches to hold the pages in place. This option sets the number of punches in each cluster. The default is three.

intraspace This governs the space between punchouts within a group. The default is 19.25mm.

punchgroups This option sets the number of groups of punches. The default is two groups.

interspace This option sets the distance between the groups of punches. The default is 51.25mm.

pageheight This fixes the height of a filofax page (not the physical paper on which it is printed). The default is 172mm.

pagewidth This fixes the width of an individual page. The physical printed area will be twice this figure. The default is 95mm, for a 190mm printed area.

grip This adjusts the distance from the edge of the page to the outer edge of the punchouts. Defaults to 5mm.

punchmargin This adjusts the distance from the edge of the text to the inner edge of the punchouts. Defaults to 2mm.

punchpoints Size, in points, of punchouts². Defaults to 15.

topspace Gap between top of filofax page and top of text page.

bottomspace Gap between bottom of filofax page and bottom of text page.

¹As a technical note, the frame itself is not rotated, because it is inserted independently of the output boxes controlled by the L^AT_EX output routine. The output modes (two-column, and a hacked-together four-column mode) have been modified to understand blocks of text as `\hboxes` to be laid atop one another, rather than as `\vboxes` to be set alongside one another.

²Please, note that the original documentation reads `punchsize` but the option name is really `punchpoints`. Also, take care to write no dimension specification after the number.

`jawspread` If set to a positive length, this places a set of rules the width of the punchmarks on either side of each punchhole, centered on its center and spread the distance specified. This can be useful as a guide with some one-hole punches that are designed to be used “blind”.

`jawline` Sets the width of the lines used to make jawmarks. The default value is 0.4pt.

3 Wrapping pstops for an easy use

Courtesy of Geert Kloosterman, here follows a script that wrap `pstops` and some of its many options in an easier command line program: all you need is the `psutils` bundle and a sh-compatible shell (ash, bash, ksh, etc.). Please, note that this script is suitable only for A4 paper size, but can be easily customized.

```
#!/bin/sh

# duplex-calendar -- print the evautlfl output 3 sheets per side (A4)
# Geert Kloosterman 2005-01-11

if [ -z "$1" ]; then
  echo "Usage: $(basename "$0") <calendar-file.ps>" 1>&2
  echo 1>&2
  echo "Redirect the output to a file or your printer." 1>&2
  echo "Make sure your printer is in tumble mode when printing." 1>&2
  exit 1
fi

shift=9.6cm
pstops -pa4 \
  "6:0(0,$shift)+2(0,0cm)+4(0,-$shift),1(0,-$shift)+3(0,0cm)+5(0,$shift)" \
  "$1"
```

4 The Style File

4.1 Preliminaries

Use $\text{\LaTeX} 2_{\epsilon}$, and tell the user who we are.

```
1 \<style>
2 \NeedsTeXFormat{LaTeX2e}[1995/06/01]
3 \ProvidesPackage{evautofl}[2005/01/20 v0.3 Filofax page outlines]
```

4.2 Options and required packages

We need a boolean to process our sole option.

```
4 \newif\if@usequadruplecolumn
```

We provide four columns as an option. Two columns (one for each side of what will be the filofax page) will be the default.

```
5 \DeclareOption{fourcolumn}{\@usequadruplecolumntrue}
```

Process the option if present, and load supporting packages.

```
6 \ProcessOptions
7 \RequirePackage{lscap}
8 \RequirePackage{keyval}
```

4.3 Calendar Setup

Declare some variables.

```
9 \newif\if@quadruplecolumn
10 \newbox\@leftleftcolumn
11 \newbox\@letrightcolumn
12 \newbox\@rightleftcolumn
13 \newbox\@rightrightcolumn
14 \newcount\af@punchcluster
15 \newcount\af@punchgroups
16 \newlength\af@interspace
17 \newlength\af@intraspace
18 \newlength\af@grip
19 \newlength\af@punchmargin
20 \newcount\af@punchsize
21 \newlength\af@punchwidth
22 \newlength\af@halfpunchwidth
23 \newcount\af@subtempcount
24 \newcount\af@tempcount
25 \newlength\af@textwidth
26 \newlength\af@marginrel
27 \newlength\af@halftextwidth
28 \newlength\af@textheight
29 \newlength\af@topmargin
30 \newlength\af@bottommargin
31 \newcount\col@no
32 \newlength\af@jawsread
33 \newlength\af@halfjawsread
34 \newlength\af@jawline
```

`\quadruplecolumn` We'll need a macro to turn on the four-column mode. This is just a modified version of `\twocolumn` in the L^AT_EX distribution.

```
35 \def\quadruplecolumn{%
36   \clearpage
37   \global\columnwidth\textwidth
38   \global\advance\columnwidth-3\columnsep
39   \global\divide\columnwidth by4\relax
40   \global\hsize\columnwidth
41   \global\linewidth\columnwidth
42   \global\@twocolumntrue
43   \global\@quadruplecolumntrue
44   \global\@firstcolumntrue
45   \col@number=4\relax}
```

4.4 Output routines

`\@opcol` Catch the output routine when the new mode is in effect.

```
46 \def\@opcol{%
```

```

47 \iftwocolumn
48 \ifquadruplecolumn
49 \outputqdrplcol
50 \else
51 \outputdblcol
52 \fi
53 \else
54 \outputpage
55 \fi
56 \global \mparbottom \z@ \global \textfloatsheight \z@
57 \floatplacement}

```

`\outputqdrplcol` Add a new output routine for the new mode, and a modified version of the two-column output routine. Note that these work *only* inside the landscape environment.

`\outputdblcol`

```

58 \def\outputqdrplcol{%
59 \ifcase\col@no
60 \global\@firstcolumnfalse

143 \endgroup}

```

4.5 Punchmarks

`\af@circle` We use circles to make punchmarks. When making circles, `TEX` will put the center of the circle at point, but consume horizontal space equal to the full diameter of the circle. To compensate, we need to skip forward by radius, and back again after

laying each circle.

```

144 \def\af@circle{%
145   \hbox{%
146     \hskip\af@halfpunchwidth
147     \ifnum\af@jawsread>0
148       \hskip-\af@halfjawsread
149       \hskip-\af@jawline
150       \vrule depth \af@halfpunchwidth
151         height \af@halfpunchwidth
152         width \af@jawline
153       \hskip\af@halfjawsread
154     \else
155       \vrule depth \af@halfpunchwidth
156         height \af@halfpunchwidth
157         width Opt
158     \fi
159   \hbox to Opt{\hidewidth\circle{\af@punchsize}\hidewidth}%
160   \ifnum\af@jawsread>0
161     \hskip\af@halfjawsread
162     \vrule depth \af@halfpunchwidth
163       height \af@halfpunchwidth
164       width \af@jawline
165     \hskip-\af@halfjawsread
166     \hskip-\af@jawline
167   \fi
168   \hskip-\af@halfpunchwidth}}

```

`\af@group` We define a looping command that lays down a cluster of circles. Grouping allows this loop to be nested in another.

```

169 \def\af@group{%
170   \begingroup
171   \af@tempcount=0
172   \af@circle
173   \loop
174     \advance\af@tempcount by 1
175     \ifnum\af@tempcount<\af@punchcluster
176       \hskip\af@intraspace
177       \af@circle
178     \repeat
179   \endgroup}

```

`\af@circles` We define a command that lays down a set of clusters (groups).

```

180 \def\af@circles{%
181   \af@tempcount=0
182   \af@group
183   \loop
184     \advance\af@tempcount by 1
185     \ifnum\af@tempcount<\af@punchgroups
186       \hskip\af@interspace
187       \af@group
188     \repeat
189   \af@tempcount=0}

```

`\af@punches` The following command creates a set of punchmarks.

```
190 \def\af@punches{%
191   \ifnum\af@punchgroups>0
192     \hbox to \af@textheight{%
193       \hfil\af@circles
194       \relax\hfil}%
195   \fi}
```

4.6 The frame

The following creates a frame. The model was lifted from the `geometry` package. The `\@@@innerframe` macro of the original `autofilo` package has been split into two new macros which draw different frames on the left and right pages of the `filofax`.

`\@@@innerframeleft` The following macro is used to draw the frame on the left pages, so the punchmarks are on the right side.

```
196 \def\@@@innerframeleft{%
197   \moveright-\af@topmargin%
198   \vbox to Opt{%
199     \vskip\topmargin%
200     \vbox to Opt{\hrule width\af@textheight\vss}%
201     \hbox to \af@textheight{\llap{\vrule height0.5\af@textwidth}%
202       \hfil\vrule height0.5\af@textwidth}%
203     \vbox to Opt{\hrule width\af@textheight\vss}%
204     \vskip-\af@halfwidth%
205     \vskip\af@grip%
206     \nointerlineskip\af@punches\nointerlineskip%
207     \vss}}%
```

`\@@@innerframeright` The following macro is used to draw the frame on the right pages, so the punchmarks are on the left side.

```
208 \def\@@@innerframeright{%
209   \moveright-\af@topmargin%
210   \vbox to Opt{%
211     \vskip\topmargin%
212     \vbox to Opt{\hrule width\af@textheight\vss}%
213     \hbox to \af@textheight{\llap{\vrule height0.5\af@textwidth}%
214       \hfil\vrule height0.5\af@textwidth}%
215     \vbox to Opt{\hrule width\af@textheight\vss}%
216     \vskip-\af@punchwidth%
217     \vskip-\af@grip%
218     \nointerlineskip\af@punches\nointerlineskip%
219     \vss}}%
```

`\@outputpage` A further modification of the output routine, this time to put the frame in place. This, too, is lifted from `geometry`. It has been modified only slightly, but we drop L^AT_EX 2.09 support altogether.

```
220 \newif\if@lATEXtwoe
221 \@ifundefined{if@compatibility}{\@lATEXtwoefalse}{\@lATEXtwoetrue}%
222 \if@lATEXtwoe

Change History

v0.1		
	General: First public release; there are certainly some bugs	1
v0.2		
	<code>\@outputdblcol</code> : Corrected the “horizontal” shift of odd pages	5
	<code>\@outputqdrplcol</code> : Corrected the “horizontal” shift of odd pages	5
	General: Added a little, stupid example of use	1
	<code>\af@circle</code> : Wrapped <code>\circle</code> into a <code>0pt</code> box to avoid weird spacing effects	6
	<code>\af@group</code> : Added a final skip to reflect changes in <code>\af@circle</code> . . .	7
	<code>\af@punches</code> : Added a control to skip everything if <code>punchgroups</code>	
		is 0; removed a skip to reflect changes in <code>\af@circle</code> and <code>\af@circles</code>
		7
v0.3		
	<code>\@outputdblcol</code> : Corrected (really) the “horizontal” shift of odd pages	5
	<code>\@outputqdrplcol</code> : Corrected (really) the “horizontal” shift of odd pages	5
	<code>\af@circle</code> : Added a missing <code>\hidewidth</code> before <code>\circle</code> . . .	6
	<code>\af@group</code> : Removed the final skip (to reflect changes in <code>\af@circle</code>) which interfered with <code>punchgroups interspace</code> . .	7
